The fauna of Wallaga Lake – a revelation and an offer

The rain promised for Thursday 2 May held off and residents of Wallaga Lake Heights, Beauty Point and places even more distant were treated to an eye-opening tour of the other inhabitants of the Wallaga Lake foreshore. Local dedicated naturalist, Deb Turner gave the gathering two hours of knowledge with some fascinating insights:

- It seems that ticks have no natural predators which is a pity
- Wasps help control the spider population;
- There are no recorded cases of a red-bellied black snake killing anyone;
- Bees are a small fraction of the insects that pollinate plants think moths.

May is a bit late in the year to examine insects in the wild – they can't handle the cold – so Deb illustrated he talk with an impressive array of photographs, most of which were taken by her in the immediate vicinity.

And, to give us a chance to put our new-found interest into practice, Deb has offered to join a few of our Land Care gatherings in the spring to take us for an invertebrate tour of the foreshore. We will let the community know when.

About Wallaga Lake Heights Care

We are always on the look-out for new members. If you or anyone you know would like to join, have any comments or queries please contact us at admin@heightscare.org.au.
